RESEARCH INTERESTS:

- Cellular / Molecular Biology and Biochemistry during gene expression in a model cell system: Insect Choriogenesis.
- Erythrocyte membrane disorders. Radioactive tracers for pharmaceutical applications.
- Effects of irradiation (lasers, UV) on the structure and function of the cornea.
- Effects of electromagnetic fields deriving from mobile phones, wireless DECT telephones, wi-fi routers, baby monitors, microwave ovens and ELF from power lines on model biological systems including insects (*Drosophila melanogaster*), mice (*Mus musculus*), nematodes (*C. elegans*), lizards (*Podacris*), rabbits and human skin.

- Health risk assessment of the various EMF frequencies (ELF and RF) following precise field measurements in houses and schools.

The on going research of our Electromagnetic Biology Research Group is focused on the effects of various kinds and sources of electromagnetic radiation (mobile phones, blue tooth, wireless DECT, baby monitor, microwave oven, wi-fi, magnetic field, e.t.c.) on the reproduction and oogenesis of the fruit fly *Drosophila melanogaster*. Our recent activities are also focused on the irradiation of the model Rodent *Mus musculus* mouse in order to reveal defects on memory, behaviour, brain proteome, reproduction, apoptosis and other lesions induced by non ionizing radiation. Our recent work involves multidisciplinary approaches engaging the most sophisticated techniques, such as the Morris water Maze behavioural task, object recognition task, proteomics analysis, transcriptomics, ROS assay, immunohistochemistry, confocal laser microscopy and electron microscopy.

Our recent results have been published in peer review journals (see publication list)

Special attention has been given throughout our research protocols to the biological effects of mobile phone radiation (for the first time worldwide using real communication conditions) on model cell systems including oogenesis in Diptera, behaviour and reproduction in rodents. The results have shown a decrease in the reproductive capacity of Drosophila and deficits in osteogenesis of newborn mice, as well as memory impairment and brain protein/gene expression changes following mobile phone and wireless DECT radiation and have been published (see publication list).

Current research is focused on the changes of cellular and molecular parameters caused by EMFs on insects of the genus *Drosophila* and on mice *Mus musculus* under a variety of exposure conditions. For this purpose a large number of commercially available EMF – producing devices are being used for the experiments.

The approaches used include:

Behavioural – memory tasks in mice
Immunohistochemistry – histology
Proteomics
Microarrays
Lipidomics
Fluorometry
Oxidative stress analysis
Confocal microscopy
Electron microscopy
Western blotting

Another issue that concerns us is the electromagnetic radiation emitted by cell phone masts. For this purpose we are performing measurements inside houses and

schools in order to inform the citizens about any excessive radiation levels even if those are within the Greek "safety levels". We strongly believe that a further reduction (below the 30% of the current law) should be decided by the government and on that direction we provide interviews in the media and well documented advice whenever needed.
